Bottle washing machine
Caustic solution preparation at Dargun Brewery

Customer:
Dargun Brewery

Background and remit:
The use of the BOLLFILTER automatic Type 6.64 for filtering the main caustic solution was a measure defined for reducing the contamination level in the bottle washing machine.

Description of the solution:
The bottles are cleaned in the washing machine using caustic soda, with the ultra-fine particles removed by the BOLLFILTER, in order to improve the quality of cleaning and protect the nozzles on the spray bars from becoming blocked.
The objective is to remove contaminants from the caustic soda solution as early as possible, in order to ensure that the lowest possible levels of residue are transported to the post treatment zones. Paper fibres, glue, ink and other contaminants are the cause of significant problems in the caustic solution. This is exactly where the BOLLFILTER automatic Type 6.64 is used in the partial flow filtration system to continuously filter the caustic solution.

Benefits and added value for the customer:
The filter has now been in use at the Dargun Brewery for over a year. Over this period the following improvements have been achieved:

- A reduction in settleable solids in the main caustic solution by 47% and by 65% in the post-caustic tank.
- An increase in the useful life of the caustic solution from 6 weeks to 6 months.
- A 90% reduction in the bottle reject rate.
- A considerably better overall condition of the machine.
- A reduction in wastewater costs.
- A reduction in deposits on the basket carriers.
- No more blockages in the spray bars.
- Significantly reduced cleaning requirements for operators during production (cleaning of the plug-in strainers, malfunctions etc.)
- No deposits in the flawless zones of the machine or in the heat exchangers.
- Improved hygiene by preventing dirt particles from depositing on the internal walls of the cleaning machine.
